Transferable accuracy

In order to achieve accuracies in the high-end range, customers must often perform a very complex and time-consuming calibration of the entire machine. Under the motto "transferable accuracy," HEIDENHAIN contributes to facilitating the mounting process for the customer and to transferring the high accuracy of our encoders to the customer's application without any losses. For the ERP 1080 Dplus encoders, this is achieved based on the following features:

- Sturdy, mechanical interface for mounting on the customer side
- Four scanning heads for position calculation for resilient angle measurement

Electrical connection

The ERP 1080 Dplus angle encoder provides four separate connections (D-sub, 15-pin) with 1 V_{PP} interface. The EIB 74x signal converters that are available from HEIDENHAIN can be used to operate the product. The product can also be connected to downstream electronics from third-party suppliers if they provide four 1 V_{PP} inputs.

Position calculation with an EIB 74x or downstream electronics from third-party suppliers

For the system to be able to reach the specified accuracy, the positions of all scanning heads need to be averaged.

$$X_{avg} = \frac{(X1_{abs} + X2_{abs} + X3_{abs} + X4_{abs})}{4}$$

X1_{abs} ... X4_{abs}: Positions of the scanning

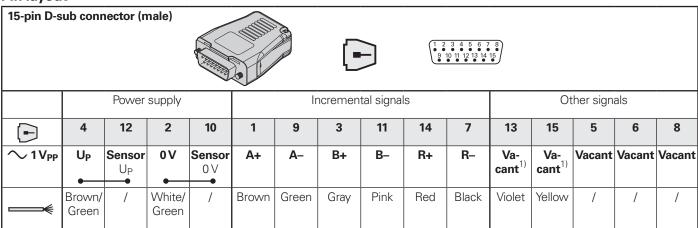

X_{ava}: Arithmetic mean value of

inputs X1_{abs} to X4_{abs}
